ANNUAL WATER QUALITY REPORT

2020 WATER TESTING PERIOD

Well #10

PWS ID #2290023
MEETING THE CHALLENGE

We are once again proud to present to you our annual water quality report. This edition covers all testing completed from January 1 through December 31, 2020. Over the years, we have dedicated ourselves to producing drinking water that meets all state and federal drinking water standards. We continually strive to adopt new and better methods for delivering the best quality drinking water to you. As new challenges to drinking water safety emerge, we remain vigilant and meet the challenges of source water protection, water conservation, and community education while continuing to serve the needs of all our water users.

Please share with us your thoughts about the information in this report. After all, well-informed customers are our best allies.

LEAD INFORMATIONAL STATEMENT

HEALTH EFFECTS AND WAYS TO REDUCE EXPOSURE

The City of Moscow is in full compliance with lead testing rules, and has never had a sample set fail for high lead content. In 2016, City of Moscow Water Staff took several samples from residences constructed during the period when lead was being used and all samples were below the federal level. In addition, we have no reason to believe that we have elevated levels of lead in the City of Moscow water system based on routine monitoring data.

However, if present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Moscow is responsible for providing high-quality drinking water but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline at 800-426-4791 or at www.epa.gov/safewater/lead.

ADDITIONAL HEALTH INFORMATION

Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Drinking Water Hotline at 800-426-4791.

WHERE DOES MY WATER COME FROM?

Moscow has six wells which draw water from two underground aquifers; the shallow aquifer known as the Wanapum, and a deeper aquifer called the Grand Ronde. Wells #2 and #3 draw water from the Wanapum System, and Wells #6, #8, #9, and #10 draw water from the Grande Ronde System.

To protect these water sources, the City has implemented best management practices designed to protect the wells and the areas that surround them.

SOURCE WATER ASSESSMENT

A Source Water Assessment for the City of Moscow was completed in 2001. The assessment determined that Wells #2 and #3 have overall higher susceptibility risk ratings, compared to Wells #6, #8 and #9. The City of Moscow has never had a sample exceed the Maximum Contaminant Level (MCL) for possible contaminates. A copy of the Source Water Assessment can be obtained from the State of Idaho Department of Environmental Quality (DEQ). For more information regarding the assessment, contact Kyle Steele at 208-883-7133.

QUESTIONS?

For more information about this report, or for any questions relating to your drinking water, please call one of the following people:

- **KYLE STEELE**
  Environmental Services Manager
  208-883-7133

- **MIKE PARKER**
  Water Utility Manager
  208-892-8624

- **TYLER PALMER**
  Deputy City Supervisor—Public Works and Services
  208-883-7096
SAMPLING RESULTS

During the past year, we have taken hundreds of water samples in order to identify the presence of any radioactive, biological, inorganic, volatile organic, or synthetic organic contaminants. The table below shows only those contaminants that were detected in the water. Although all of the substances listed here are under the Maximum Contaminant Level (MCL), we feel it is important that you know exactly what was detected and how much of the substance was present in the water. The state allows us to monitor for certain substances less than once per year because the concentrations of these substances do not change frequently. In these cases, the most recent sample data are included, along with the year in which the sample was taken.

The MCL for beta particles is 4 mrem/year. The U.S. EPA considers 50 pCi/L to be the level of concern for beta particles.

DEFINITIONS

**AL**  
Action Level – The concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

**MCL**  
Maximum Contaminant Level – The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

**MCLG**  
Maximum Contaminant Level Goal – The level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**MRDL**  
Maximum Residual Disinfectant Level – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**MRDLG**  
Maximum Residual Disinfectant Level – The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.

**NA**  
Not Applicable

**pCi/L**  
Picocuries per Liter – A measure of radioactivity.

**ppb**  
Parts per Billion – One part substance per billion parts water (or micrograms per liter).

**ppm**  
Parts per Million – One part substance per million parts water (or milligrams per liter).
SUBSTANCES THAT COULD BE IN WATER

To ensure that tap water is safe to drink, the U.S. EPA prescribes regulations limiting the amount of certain contaminants in water provided by public water systems. U.S. Food and Drug Administration regulations establish limits for contaminants in bottled water, which must provide the same protection for public health. Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of these contaminants does not necessarily indicate that the water poses a health risk.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and aquifers. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals, in some cases radioactive material, and substances resulting from the presence of animals or from human activity. Substances that may be present in source water include:

- MICROBIAL CONTAMINANTS, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, or wildlife
- INORGANIC CONTAMINANTS, such as salts and metals, which can be naturally occurring or may result from urban stormwater runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming
- PESTICIDES AND HERBICIDES, which may come from a variety of sources such as agriculture, urban stormwater runoff, and residential uses
- ORGANIC CHEMICAL CONTAMINANTS, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and may also come from gas stations, urban stormwater runoff, and septic systems
- RADIOACTIVE CONTAMINANTS, which can be naturally occurring or may be the result of oil and gas production and mining activities

For more information about contaminants and potential health effects, call the U.S. EPA’s Safe Drinking Water Hotline at 800-426-4791.
As you can see in the water quality testing included in this report, the Moscow Water Staff diligently monitor the water that is produced and distributed to the community to ensure that it is safe for all Moscow residents. However, this is not the end of the story for the safety of your water. The fixtures, faucets, equipment, and systems in the homes and businesses connected to the distribution pipes are a direct route for potentially harmful stuff which can contaminate your water supply. The City’s Cross Connection Control Program (CCCP) is in place to ensure that undesirable and hazardous materials are not introduced into your water system, through a process called backflow, and distributed to the rest of the community. This program is required by the “Idaho Rules for Public Drinking Water Systems” (IDAPA 58.01.08) and Moscow City Code Title 7, Chapter 9.

A cross connection is any actual or potential connection to the public water system through which it is possible to introduce anything other than the intended potable water. This includes used water (water that has left the City’s distribution system), biological or chemical contaminants, and water from auxiliary (private) wells. Backflow is the flow of any liquids (including used water), gases, or substances in the wrong direction back into the public water supply. This can happen in two ways: by a drop in pressure in the distribution system that creates backsiphonage, which pulls water backwards; or by an increase in pressure on an external system that creates backpressure, which pushes water backwards.

When it is determined that a cross connection which may endanger your public water supply is present, an approved backflow assembly must be installed. A backflow assembly is a device which is designed to be tested and repaired without having to be removed. All backflow assemblies must be inspected and tested annually by a State of Idaho licensed Backflow Assembly Tester (BAT). Note that an assembly that fails testing must be repaired, replaced, or isolated within ten (10) business days, or water service must be shut off. Over the past five years an average of 6.0% of backflow assemblies in Moscow failed the initial test.

The protection of Moscow’s water supply is of critical importance to both the City of Moscow and its citizens. If you have any questions about the CCCP or would like to schedule a cross connection assessment, please contact Ty Thompson at tthompson@ci.moscow.id.us or by calling 208-883-7111.
BREWERS’ INFORMATION

Brewers have long recognized how important consistent, high-quality water is to the brewing process and creating great beer. Water comprises between 90 to 95 percent of beer by mass, which means you need great water to make great beer!

Beer brewing is both art and science, so it’s critical to understand certain chemical properties of the water used in the brewing process. With this in mind, here are some common water quality characteristics, unique to Moscow’s water sources, which brewers ask us about and evaluate before making a new batch:

<table>
<thead>
<tr>
<th>WATER QUALITY CHARACTERISTIC</th>

</tr>
<tr>
<td>Sulfate</td>
<td>23.3 mg/L</td>
</tr>
<tr>
<td>Chloride</td>
<td>4.2 mg/L</td>
</tr>
</tbody>
</table>

For additional information on Moscow’s water characteristics and chemical properties, please contact the Water Department at 208-882-3122.
NOTICE
UNREGULATED CONTAMINANT MONITORING REGULATION 4 SAMPLE RESULTS AVAILABLE

The City of Moscow’s Public Drinking Water System (PWS) is required to provide special notice to residents served by the system of the availability of monitoring results from sampling that occurred last year to comply with the Federal Unregulated Contaminant Monitoring Regulation 4 (UCMR 4). The UCMR 4 requires all PWSs serving 10,000 or more individuals to conduct monitoring for unregulated contaminants.

For more information regarding the UCMR 4, please contact Kyle Steele, Environmental Services Manager, at 208-883-7133.

CALL US FIRST

If you are unsure if a particular issue is your responsibility, call the City first. We will gladly help determine the source of the problem. Some of the services provided by The City of Moscow’s Public Works and Services Group include:

- **WATER** – For water related questions and concerns such as no water, low pressure, water leaks, taste and odor concerns, please call 208-882-3122.

- **SEWER** – For concerns pertaining to sewer overflows, backups or odors, please call 208-882-2725.

- **STREETS** – For blocked storm drains, debris, potholes, street lights or traffic signal outages, please call 208-883-7097.

- **WATER BILLING** – For questions related to your water bill, including payments, please call 208-883-7043.

If you would like to see some of the Frequently Asked Questions (FAQs) that the Water Department receives, please visit our website at [www.ci.moscow.id.us/FAQ.aspx?TID=26](http://www.ci.moscow.id.us/FAQ.aspx?TID=26)
